Introduction. Studying of the Latin language plays an important role in training of future specialists in medicine and pharmacy. Doctors, pharmacists and medical workers from all over the world study and use Latin. They use national languages in professional communication, but dominance is still owned by greek and latin terminology, words and phrases which are common since ancient times. That is why, we must give special importance to the study of Latin which is necessary in practice of pharmacists. One of the branches of alternative medicine is aromatherapy, in which essential oils are used as active substances. Oils have a wide range of pharmacological activity and contain in medical and cosmetic products. Proper use of oils is possible only with knowledge about their latin names and names of sources of obtaining of medicinal plant raw material (MPM).

Up to now not enough works have been devoted to systematization of latin terminology in aromology. Therefore, generalization of information about latin names of essential oils and medicinal plants is relevant.

Aim of research. The aim of our work is collection, analysis and systematization of information about latin terminology in aromology.

Materials and methods. Analysis and processing of literary sources.

Results and conclusion. According to the results of analysis, information about the names of medicinal plants and essential oils and their application in aromology and pharmacy is generalized.

According to the result of processing of more than 10 sources collection and analysis of information about 63 medicinal plants, which are the source of obtaining of essential oils were conducted and their ukrainian and latin botanical names were shown.

Collection and analysis of information about essential oils which are used in aromology and pharmacy and properties of these oils were carried out and their latin names were given.

The use of latin terminology in aromology is necessary, not only because it is generally accepted, but also because latin names of plants and essential oils and used around the world for accessibility of information.

The names of the majority of drugs that were used for the analysis, do not include the names of essential oils or plants that the drugs contain.

In **conclusion**, the use of latin terminology is important in aromology, as well as in other fields of medicine and pharmacy.
