The title compound, $C_{11}H_{11}NO_4S$, possesses weak analgesic properties and is a source compound for the synthesis of highly active analgesic and anti-inflammatory compounds. The benzothiazine ring adopts a conformation intermediate between twist-boat and sofa. The ester substituent is turned towards the endocyclic double bond because of steric repulsion. In the crystal, the molecules form columns along the [001] direction, bound by $N-H \cdots O$ hydrogen bonds and stacking interactions.

1. Chemical context

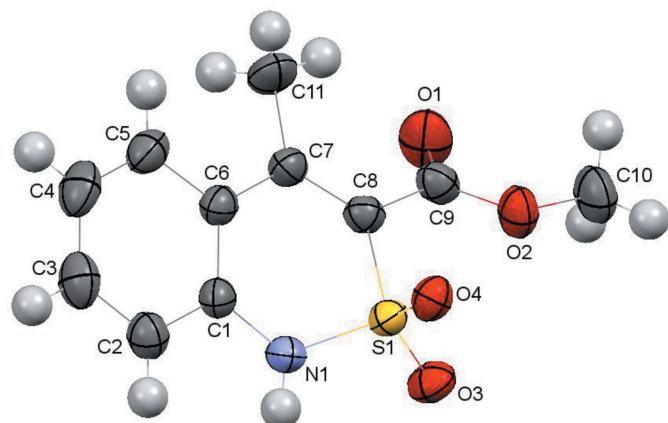

Methyl 4-methyl-2,2-dioxo-1*H*-2 λ^6 ,1-benzothiazine-3-carboxylate (**I**) displays moderate analgesic properties (Azotla-Cruz *et al.*, 2017) but has been used for the synthesis of highly active analgesic and anti-inflammatory compounds (Ukrainets *et al.*, 2018). Earlier it was shown (Ukrainets *et al.*, 2016*a,b*) that the biological properties of 2,1-benzothiazine derivatives depend to a considerable degree on their molecular and crystal structures. Thus knowledge of both the molecular and crystal structures of **I** is very important.

2. Structural commentary

The molecular structure of the title compound is shown in Fig. 1. The dihydrothiazine heterocycle adopts a twist-boat conformation with puckering parameters (Zefirov *et al.*, 1990) $S = 0.57$, $\Theta = 53.3^\circ$, $\Psi = 25.2^\circ$. The S1 and C8 atoms deviate from the mean plane of the remaining ring atoms by 0.7941 (6) and 0.260 (2) Å, respectively. Some steric repulsion between the methyl substituent at the C7 atom and the ester group [the short intramolecular contact $C11 \cdots O1$ is 2.986 (5) Å compared to the van der Waals radii sum of 3.00 Å (Zefirov, 1997)] is compensated for by the formation of the intramolecular $C11-H11C \cdots O1$ hydrogen bond (Table 1). As a

result, the ester substituent is turned relative to the $C_7=C_8$ endocyclic double bond [$C_7=C_8-C_9-O_1$ torsion angle is $-35.2(5)^\circ$] and the $C_7=C_8$ [1.359 (4) Å] and C_8-C_9 [1.504 (3) Å] bonds are elongated compared to the standard values (Bürgi & Dunitz, 1994) of 1.326 and 1.455 Å, respectively. The methyl group of the ester substituent is in an anti-periplanar conformation relative to the C_8-C_9 bond [$C_8-C_9-O_2-C_{10} = 174.5(2)^\circ$].

3. Supramolecular features

In the crystal, molecules of **I** form columns along the [001] direction (Fig. 2). Neighboring molecules within the column are linked by the $N_1-H_1N\cdots O_4^i$ hydrogen bonds (Table 1)

**Figure 2**

The packing showing columns of molecules along the c -axis direction.

and π -stacking interactions with centroid–centroid diatances of 3.870 (2) Å. The columns are connected by weak $C_4-H_4\cdots O_3^{ii}$ hydrogen bonds (Table 1).

4. Database survey

An search of the Cambridge Structural Database (Version 5.39, update February 2018; Groom *et al.*, 2016) revealed only three similar 1,2-benzothiazine derivatives with a methyl substituent at the C_7 atom (VAZQEV and VAZQIZ, Azotla-Cruz *et al.*, 2017; OWUQII, Azotla-Cruz *et al.*, 2016). All of these compounds are substituted at the nitrogen atom and have very similar molecular structures. The structure VAZQEV differs from others by the *trans*-orientation of the

carbonyl group of the ester substituent relative to the endocyclic double bond.

4.1. Synthesis and crystallization

Methyl (chlorosulfonyl)acetate (1.90 g, 0.011 mol) was added dropwise with stirring to a solution of *ortho*-amino-acetophenone (1.35 g, 0.010 mol) and triethylamine (1.54 mL, 0.011 mol) in CH_2Cl_2 (20 mL) and cooled to 268–273 K. After 10 h, water (50 mL) was added to the reaction mixture, which was then acidified to pH 4 with 1 N HCl and mixed thoroughly. The organic layer was separated off, dried over anhydrous CaCl_2 , and the solvent distilled (at reduced pressure at the end). The resulting anilide was subjected to heterocyclization without purification. A solution of sodium methylate in anhydrous methanol [from metallic sodium (0.69 g, 0.030 mol) and absolute methanol (15 mL)], the mixture was boiled and then kept for 15 h at room temperature. The reaction mixture was diluted with cold water and acidified with 1 N HCl to pH 4. Finally, the solid ester, **I**, was separated by filtration, washed with water, and dried in air giving colourless block-shaped crystals, yield: 2.25 g (89%); m.p. 476–578 K (methanol); $R_f = 0.37$. ^1H NMR (400 MHz, $\text{DMSO}-d_6$): δ 11.84 (*br s*, 1H, NH), 7.79 (*d*, 1H, $J = 7.6$ Hz, H-5), 7.49 (*t*, 1H, $J = 7.2$ Hz, H-7), 7.22 (*t*, 1H, $J = 7.6$ Hz, H-6), 7.12 (*d*, 1H, $J = 8.0$ Hz, H-8), 3.84 (*s*, 3H, OCH_3), 2.46 (*s*, 3H, 4- CH_3 , coincides with the signal of residual protons $\text{DMSO}-d_6$). ^{13}C -NMR (100 MHz, $\text{DMSO}-d_6 + \text{CDCl}_3$): δ 161.6 ($\text{C}=\text{O}$), 147.7, 138.2, 132.2, 127.4, 127.1, 123.0, 121.3, 118.8, 52.9 (OCH_3), 17.5 (4- CH_3). MS (m/z , %): 253 [$M]^+$ (4.4), 252 [$M - \text{H}]^+$ (1.5), 221 [$M - \text{CH}_3\text{OH}]^+$ (8.4), 195 (80.2), 119 (75.3), 103 (17.0), 93 (100), 92 (59.5), 77 (50.0). Analysis calculated for $\text{C}_{11}\text{H}_{11}\text{NO}_4\text{S}$: C, 52.16; H, 4.38; N, 5.53; S 12.66%. Found: C, 52.07; H, 4.30; N, 5.46; S 12.72%.

5. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All of the H atoms were located in difference-Fourier maps. The N-bound H atoms were refined isotropically. The C-bound H atoms were included in calculated positions and treated as riding: C—H = 0.96 Å with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for the methyl groups and C—H = 0.93 Å with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for all others.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
