STUDY OF THE ISSUE OF PROSPECTS FOR IMPROVEMENT THE POPULATION PROVISION WITH HOMEOPATHIC MEDICINES IN CURRENT CONDITIONS

Homeopathy attracts attention of scientists and practitioners due to the peculiarities of therapy based on the use of homeopathic medicines (HomMed) in very small doses (benefits – preventive and therapeutic targeting, the effect on the level of the whole organism, no side effects and complications, etc.). Therefore there is a need to study the condition of the population support by HomMed and clarify possible ways to improve it. All of the above predetermined the goal of our study.

Primarily the presence of HomMed of industrial production was investigated in the pharmaceutical market of Ukraine. It was found that more than 217 names are registered, including 90.0% of them that are of foreign origin from countries such as Germany, Australia, Russia, Italy, El Salvador, Switzerland, France and others. Accordingly, domestic producers make only 10.0 % of HomMed nomenclature. Manufacturers: «Homeopathic National Union» – 21 names, «Biolik» – 2 names. Thus, domestic HomMed can not fully meet the needs of today's population in this extent, especially for future needs. It's required to find ways to expand the nomenclature of HomMed of domestic production, including the way through the pharmacy manufacturing. In Ukraine, manufacturing of HomMed in homeopathic pharmacies has always been popular ever since the creation of the first such pharmacy in Kiev in 1835. Today the network of homeopathic pharmacies is also developed, although in most cases homeopathic departments are created in existing general purpose pharmacies, which have kept (or created) conditions for extemporal manufacturing of drugs.

Therefore, studies confirmed that the perspective directions of improvement of population provision with HomMed could be expansion of homeopathic pharmacy (departments) in conjunction with the provision of homeopathic care and also reconstruction of conditions for extemporal manufacturing of HomMed in pharmacies. These researches took place, but more than 20 years ago. Thus, the justified criterias were the evaluated, reasonability of establishing homeopathic pharmacy (departments) normalized number of such pharmacies, conditions for extemporal manufacturing of HomMed, design and equipment of homeopathic pharmacy, organization of the labor process of specialists and others. (O.M. Dolzhnikova, 1992, D.N. Abdulyayev, 1992; N.V. Subotnikova, 1994). But such studies were not conducted in pre-

sent market conditions. Therefore this area is perspective. Particular attention should be paid to the creation of normative justification of organizational, material and technical manufacturing of HomMed in pharmacies.

Scientific field of manufacturing of new home HomMed of industrial and pharmaceutical production in a variety of medicinal forms remains relevant. The study showed that preference may be given to tablets, drops, solutions, granules, ointments.

Thus, there are perspective directions for improving of population provision with HomMed in modern conditions. They are organizational, economic, material and technical (expanding the network of specialized homeopathic pharmacies with the right for extemporal manufacturing of HomMed using prescription of homeopaths, design and equipment of them, creating homeopathic departments based on existing pharmacies with the organization of the workplace for extemporal manufacturing of HomMed), organizational, technological and industrial (technological development of new domestic HomMed) and pharmacy (technological justification of new compositions and dosage forms for extemporal manufacturing in pharmaceutical conditions) directions.
